Hi Shaikh,

Welcome to your WheelMetrics Pro analysis for the week of 1 June 2026.

The options scan is thinner than usual this week, but there are still a few good setups in here if you have th

Let's dive in.

The TL;DR

- **Market stance:** SPY is closing in on its ninth straight winning week, but oil whipsawed hard on Iran is still north of 5.10%. Calm on the surface, but real tension underneath.
- **If you took the semiconductor plays the past two weeks, here's what that looked like.** Micron r week and +53% on the month, CRDO tacked on +8%.
- **Additionally, all three gold names I flagged (NEM, Barrick, and CDE) closed green.** Though, I exp and Iran tensions.
- **Two new names on the screener.** PENG is a $55 semiconductor play and a lower-cost way to get an oil & gas name at a forward PEG of 0.8 that adds some energy balance against gold. Both need
- **Screener housekeeping.** I widened the options screener's delta filter to run from 0 to 0.30 (it used downside cushion and still-solid yield. Details further down.
- **AMD is the cleanest setup on the scan.** The $390 strike put at 46 DTE gives you a 0.15 delta, ~21% technical support sitting between $360 and $390.
- **CDE is the best bang for your buck in gold for this week.** The $15 strike at 46 DTE puts you 20% o ~35% from its February high. If assigned at $15 the stock would be down 50% from February, which
- **What I'm doing:** I opened a CENX cash-secured put last week, I'm letting my NEM and CDE positio settle. I'll also be paying close attention to CRDO reporting earnings after the closing bell on Monda

Market Summary

SPY is closing in on its ninth consecutive winning week, with mega-cap tech and AI-linked semiconductors

The VIX slid to a four-month low last week, and CNN's Fear and Greed Index reads "Neutral" to "Mildly Gre

However…that calm got tested over the weekend.

Oil dropped below $100 a barrel on Friday, closing near $90, on hopes the Iran war was winding down, and

Then fresh bombings on Iranian sites over the weekend pushed crude right back up this morning, and gold

Meanwhile the bond market still isn't relaxing: the 30-year Treasury yield is sitting above 5.10%, its highest
is higher, not lower.

Add earnings season wrapping up with post-earnings volatility still settling across a lot of names, an

High-quality Stocks

This week's stock report is effectively identical to last week's with one semiconductor name and three gol

AMD

- Own in investment portfolio, not enough capital to Wheel
- 69-70% IV
- Days to earnings: 64

If you have the capital, AMD is the cleanest setup on the entire scan this week.

AMD is trading at $490.08 and it has not cooled off — up 10% last week and 53% over the past month.

The $390 strike at 46 DTE is the one I'd take with 0.15 delta, ~21% annualized yield, 20% out of the money,

If you want more premium, the $400 strike bumps you to ~25% annualized and a 3.15% ROC, but your cus

I'd err on the safer side here.

Semiconductors have been running hot, and when a sector is this stretched I want *more room underneath*

There's also a technical reason: AMD has a support zone with a bit of a gap roughly between $360 and $39

The catch is the capital — roughly $39,000 per contract, so you'll need some deeper pockets to capitalize

NEM

- Currently Wheeling ($105 strike CSP, exp 06/18)
- 45-46% IV

- Days to earnings: 52

NEM is still my top-quality gold name, even if it's the priciest way in.

NEM is trading at $106.61, and the $97.50 strike at 46 DTE gives you a 0.26 delta, 24.5% annualized yield, 8

I'm already Wheeling NEM at the $105 strike (exp 06/18), and I'm not expecting much movement on that or

If I get assigned, that's fine. I'll move into covered calls and start grinding the cost basis down, the same wa

At roughly $9,750 per contract, NEM is the most expensive of the three gold plays.

B (Barrick)

- Own in investment portfolio, waiting for next entry
- 44-45% IV
- Days to earnings: 71

Barrick is your middle-tier gold entry if NEM is too heavy and CDE feels too cheap.

B is trading at $40.97, and the $38 strike at 46 DTE gives you a 0.28 delta, 25.47% annualized yield, 7.25% c

That's the highest annualized yield of the three gold names, at a capital requirement of about $3,800 per c

Personally, I'm *not* adding more gold to my own book right now. I already have CDE shares and an open NE

But Barrick is still a genuinely good stock and a clean mid-priced way in.

CDE

- Own in investment portfolio, currently Wheeling (CC phase)
- 72-73% IV
- Days to earnings: 65

CDE is the best bang for your buck in gold this week.

CDE is trading at $18.76, and the $15 strike at 46 DTE puts you **20% out of the money** with a 0.16 delta, 23

For about $1,500 a contract, that's the cheapest gold exposure on the scan. Far less than B at $3,800 or NE

The raw premium is smaller because the stock trades cheap, but you can scale up your contract count if y

Here's the part I like most:

Back in late February, CDE's high was around $30, so at $18.76 it's already off roughly 35%. And if it di high.

For a name I'm bullish on over the long haul, that's a retracement entry with real upside once the volatility

I've been Wheeling CDE all year, and it's the most-Wheeled stock in my account.

A Note on Gold This Week

Three of my four focus picks are gold miners, mostly because that's what the macro market is handing us r

Here's the short version of how gold moved the past calendar week:

1. On Friday, oil dropped on hopes the Iran war was de-escalating, and gold miners rose.
2. Over the weekend, fresh bombings on Iranian sites reversed that, oil bumped back up, and gold sta
3. That whipsaw, inside a single weekend, is *exactly* why I won't try to trade the Iran headlines directly

Despite moves to the upside end of last week, my honest read is that gold isn't out of the woods yet.

Rising real yields on U.S. Treasuries are a near-term headwind, and they can keep gold trading sideways-to

But once the Iran war narrative resolves and oil prices come back down, inflation takes center stage again

If you enter a gold position here, if assigned, plan to hold the thesis for at least 6-12 months while the

Other Noteworthy Stocks

Also on the screener this week:

- **MU (★★★):** Still the strongest fundamental name on the board — 5/6 value, 5/6 growth, 66% PE up own it but can't Wheel it on my capital, and there's no affordable setup this week. It also just ran +2
- **CRDO (★★★):** Reports earnings after the close tonight (June 1st). I've been bullish on it all year. It's I look at any new setups. More on this below.
- **PENG (★★★):** New to the screener and the watchlist — 4/6 value, 3/6 growth, free cash flow at 180 semiconductor name and a lower-cost way to get chip exposure than AMD or MU. **Needs more res** promising.
- **MTDR (★):** Also new — 3/6 value, 5/6 dividend, 30% five-year revenue growth, a forward PEG of 0.8 the radar, no setup yet.
- **SNDK (★★★):** Strong numbers again — 33% ROIC, 34% profit margin, 118% revenue growth next y there for me.

Options Setups Worth Watching

One housekeeping note before the setups:

I widened the options screener's delta filter, removing the old 0.20 lower bound so the range now runs 0 to

The reason I did this is because I started noticing quality CSP setups below the 0.2 mark that still provided

I'll keep this setting moving forward and if I revert back, I'll be sure to log it in the weekly email announcem

AMD: $390 strike at 46 DTE

This is the setup I'd most want to own this week if I had the capital.

AMD is trading at $490.08, and the $390 strike gives you 20% out of the money, a 0.15 delta, ~21% annuali

Support sits between $360 and $390, so you've got a technical floor under the strike.

Capital requirement: roughly $39,000 per contract.

CDE: $15 strike at 46 DTE

The cheapest gold exposure on the scan, and my pick for best value.

CDE is trading at $18.76, and the $15 strike puts you 20% out of the money with a 0.16 delta, 23.8% annua

Capital requirement: roughly $1,500 per contract.

At ~35% off its February high already, this is the retracement entry I keep coming back to.

NEM: $97.50 strike at 46 DTE

The highest-quality gold name, if your account can carry it.

NEM is trading at $106.61, and the $97.50 strike gives you 8.5% OTM with a 0.26 delta, 24.5% annualized y

Capital requirement: roughly $9,750 per contract.

B: $38 strike at 46 DTE

The middle-tier gold play, and the best annualized yield of the three.

B is trading at $40.97, and the $38 strike gives you 7.25% OTM with a 0.28 delta, 25.47% annualized yield, a

Capital requirement: roughly $3,800 per contract.

Watchlist

Current status of the names I'm tracking week to week:

- **MU:** Own in investment portfolio, not enough capital to Wheel — still the top fundamental name on
- **CRDO:** Own in investment portfolio, currently Wheeling (CSP phase) — earnings tonight, watching

- **CLS:** Own in investment portfolio, waiting for next entry — strong growth and ROIC, but capital-hea
- **AMD:** Own in investment portfolio, not enough capital to Wheel — best options setup on the scan t
- **NEM:** Currently Wheeling ($105 strike CSP, exp 06/18) — may get assigned, and that's fine
- **B:** Own in investment portfolio, waiting for next entry — clean mid-tier gold setup, but I don't need r
- **CDE:** Own in investment portfolio, currently Wheeling (CC phase) — most-Wheeled stock in my ac
- **SSRM:** Own in investment portfolio, waiting for next entry — profitability dipped after the latest earn
- **CENX:** Currently Wheeling ($50 strike CSP, exp 07/17) — opened last week, strong PE upside and e
- **THG:** Own in investment portfolio, waiting for next entry — 6/6 value, 5/6 dividend, finance diversifi
- **PSTL:** Waiting for next entry — stable Postal Service REIT, 4.3% yield, volatility hedge
- **UVE:** Waiting for next entry — similar to THG with less capital, 6/6 value, no debt
- **INDV:** Needs more research — pharmaceutical diversification play, strong growth but negative free
- **IFS:** Waiting for next entry — financial services, 288% PE upside, forward PEG 0.1, 3.6% yield
- **PENG:** Needs more research — new this week, $55 semiconductor play, lower-cost chip exposure
- **MTDR:** Needs more research — new this week, oil & gas exposure to balance gold
- **Removed this week: CGAU** — pruning gold names; there are better gold options on the board

What I'm Doing This Week

Last week I opened a cash-secured put on CENX (currently trading at $67.37):

- $50 strike expiring July 17th
- sold for $1.46
- 0.128 delta, 25% out of the money, and a 3.04% ROC over 52 days

CENX is an aluminum name, and it pairs nicely with the CSTM position I already hold in the same space.

I'd been watching CENX for several weeks, and this was finally a setup worth taking.

Beyond that, this is a patience week:

- My NEM cash-secured put at the $105 strike is just going to sit there until June 18th. If I get assigned
- My CDE position is still in the covered-call phase, and I'm chipping the cost basis lower trade by tra

- My CSTM CSP ($29 strike, expires June 18th) is currently up 53%. If CSTM goes on a run I could pote

I *will not* be adding more gold to my own book right now.

Between my CDE shares and the open NEM put, I already have the gold exposure I want, so I'm leaving Ba

The rest of my week goes to two things.

1. First, research on the two new names, PENG on the semiconductor side and MTDR on the oil & gas
2. Second, CRDO reports after the close tonight, and I want to see how the print lands before I touch a

With this much macro noise and this many names still settling after earnings, I'm not forcing anythin
